

Sprint 01

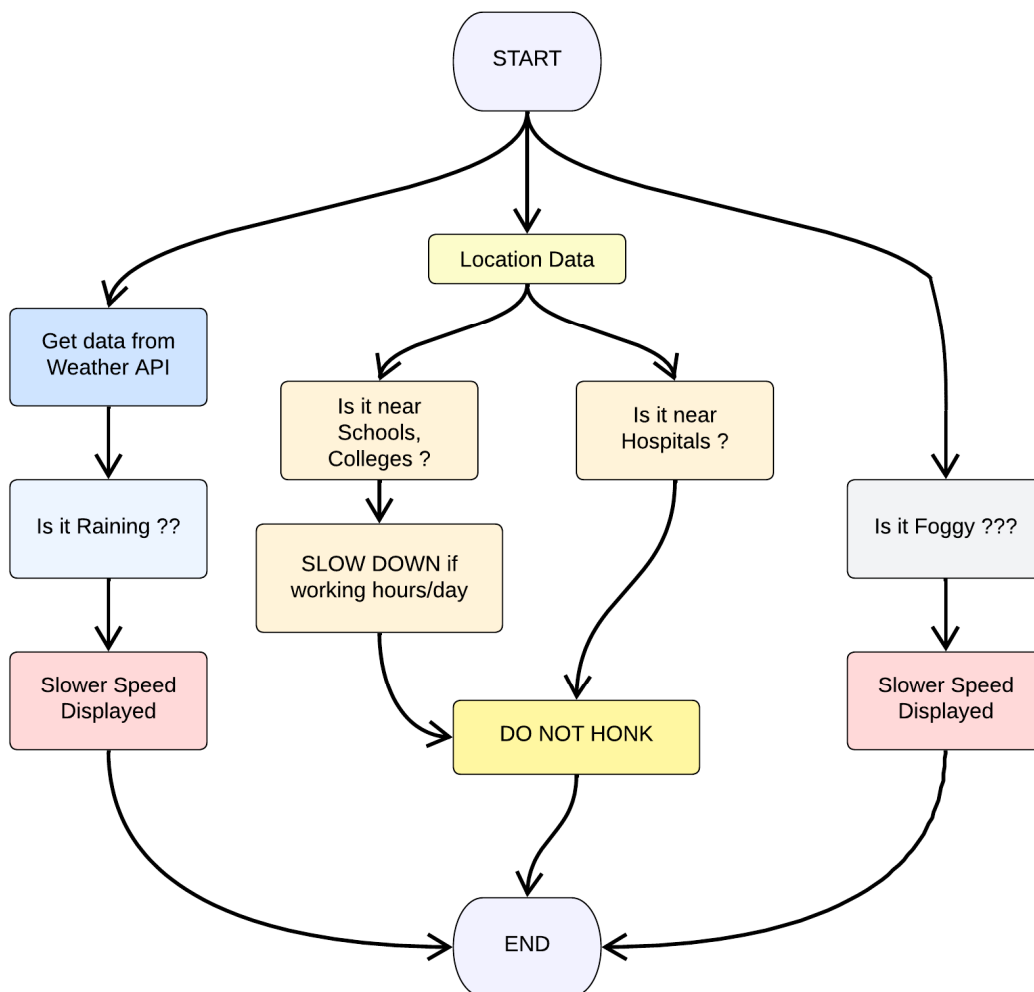

Signs with Smart Connectivity for Better Road Safety

Team ID - PNT2022TMID28982

Sprint Goals:

1. Create and initialize accounts in various public APIs like Open Weather API.
2. Write a Python program that outputs results given the inputs like weather and location.

Code Flow:

Program Code:

> weather.py

This file is a utility function that fetches the weather from OpenWeatherAPI. It returns only certain required parameters of the API response.

Python code

import requests as reqs

def get(myLocation,APIKEY):

 apiURL = f"https://api.openweathermap.org/data/2.5/weather?q={myLocation}&appid={APIKEY}"

 responseJSON = (reqs.get(apiURL)).json()

 returnObject = {

 "temperature" : responseJSON['main']['temp'] - 273.15,

 "weather" : [responseJSON['weather'][_]['main'].lower() for _ in
range(len(responseJSON['weather']))],

 "visibility" : responseJSON['visibility']/100, # visibility in percentage where 10km is 100% and
0km is 0%

 }

 if("rain" in responseJSON):

 returnObject["rain"] = [responseJSON["rain"][key] for key in responseJSON["rain"]]

 return(returnObject)

> brain.py

This file is a utility function that returns only essential information to be displayed at the hardware side and abstracts all the unnecessary details. This is where the code flow logic is implemented.

#Python code

IMPORT SECTION STARTS

import weather

from datetime import datetime as dt

```

# IMPORT SECTION ENDS

# -----

# UTILITY LOGIC SECTION STARTS

def processConditions(myLocation,APIKEY,localityInfo):
    weatherData = weather.get(myLocation,APIKEY)

    finalSpeed = localityInfo["usualSpeedLimit"] if "rain" not in weatherData else
localityInfo["usualSpeedLimit"]/2

    finalSpeed = finalSpeed if weatherData["visibility"]>35 else finalSpeed/2

    if(localityInfo["hospitalsNearby"]):
        # hospital zone
        doNotHonk = True
    else:
        if(localityInfo["schools"]["schoolZone"]==False):
            # neither school nor hospital zone
            doNotHonk = False
        else:
            # school zone
            now = [dt.now().hour,dt.now().minute]
            activeTime = [list(map(int,_.split(":"))) for _ in localityInfo["schools"]["activeTime"]]

            doNotHonk = activeTime[0][0]<=now[0]<=activeTime[1][0] and
activeTime[0][1]<=now[1]<=activeTime[1][1]

    return({
        "speed" : finalSpeed,
        "doNotHonk" : doNotHonk
    })

# UTILITY LOGIC SECTION ENDS

> main.py

```

The code that runs in a forever loop in the micro-controller. This calls all the util functions from other python files and based on the return value transduces changes in the output hardware display.

```
